

# R Programming

Presented By

**Shobha Rani**  
**Associate Professor**

Aided By Govt. of Karnataka

Master of Computer Applications  
Dr. Ambedkar Institute of Technology, Bengaluru-56

# What is R

- R is a language used for statistical computations, data analysis and **graphical representation of data**.
- **R** was created by **Ross Ihaka** and **Robert Gentleman** at the University of Auckland, New Zealand in 1990.
- **R** is **named** partly after the first names of the first two **R** authors partly as a play on the name of S.
- R was designed as a statistical platform for data cleaning, analysis, and representation.
- **R** allows you to integrate with other languages (C, C++).

# Why R

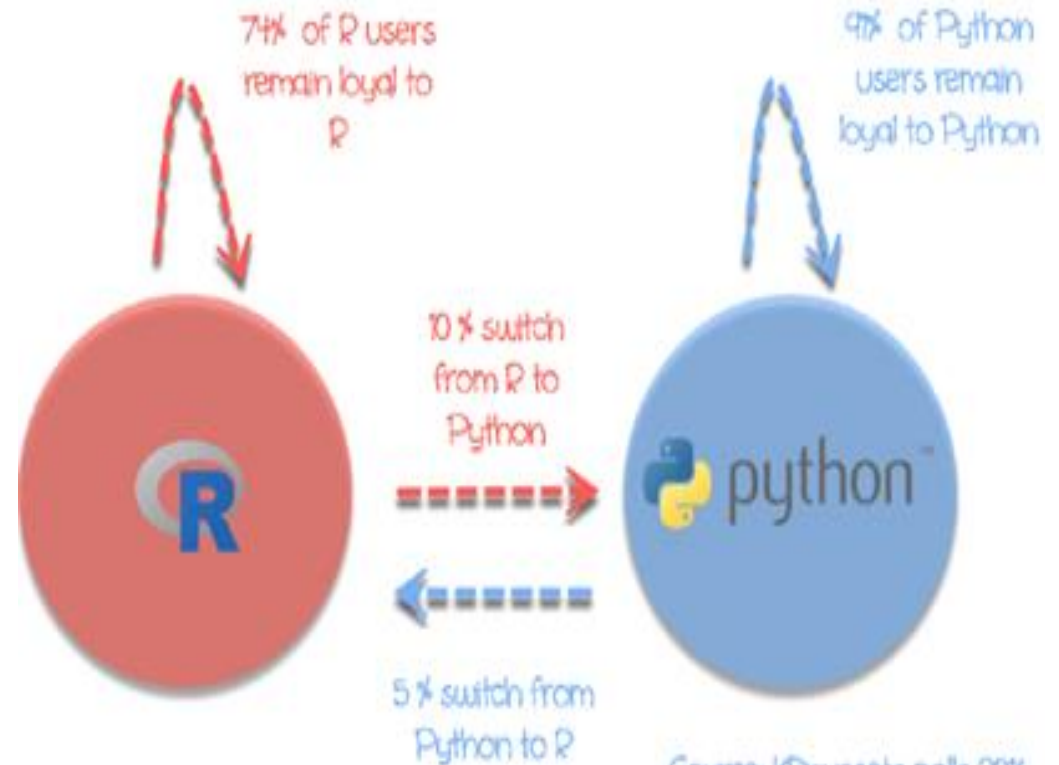

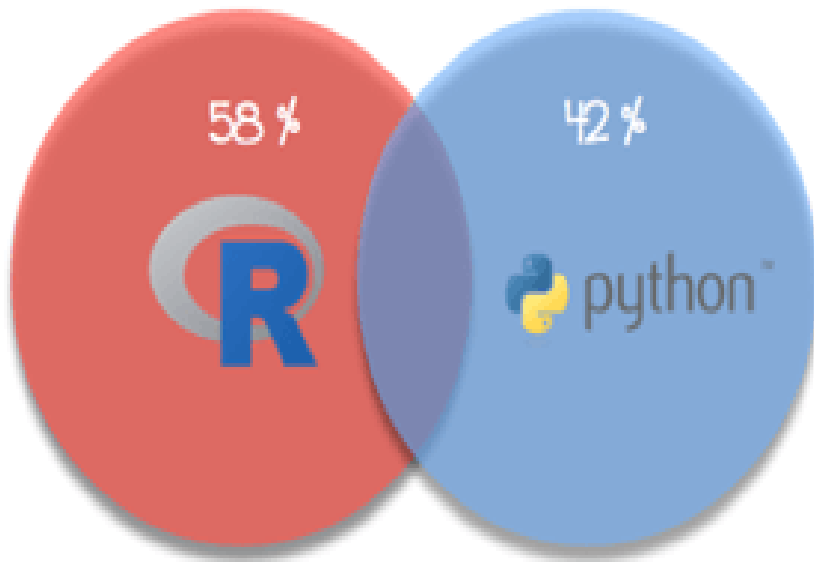

- It has been in use even before the word “Data Science” was coined.
- Statisticians and Data Scientists are most familiar with R than any other programming languages.
- Out of all surveyed data scientist, **40% prefer R**, **34% prefer SAS** and **26% Python**.
- R was built as a statistical language, it suits much **better** to do statistical learning.
- **Python is a better** choice for machine learning with its flexibility for production use, especially when the data analysis tasks need to be integrated with web applications

# R Vs Python

kDnuggets polls, 2014

Source: kDnuggets polls 2014

# Why R

- It offers an interface for many database like SQL and even spread sheets.
- R interface with NoSQL databases and analyze unstructured data.
- Developers can easily write their own software and distribute it in the form of add-on packages.
- It includes machine learning algorithms, linear regression, time series, statistical inference to name a few.
- Industries like Google, LinkedIn and Facebook, rely on R for many of their operations

# First Look of R Studio

The screenshot displays the RStudio environment with the following components:

- Scripts:** A text editor window titled 'Untitled1' containing the word 'Scripts' in red.
- Environment/History:** A pane showing 'Global Environment' with the message 'Environment is empty' and the text 'Environment/History' in red.
- Console:** A terminal window showing the R version 3.4.0 (2017-04-21) and various help messages.
- Files:** A file explorer window showing a list of files and folders in the Home directory.

# Set the working directory

➤ **setwd(“directory path”)**

*or*

➤ *Choose a suitable location by clicking on the indicated icon from Files/plots/packages Window*

➤ *Once directory is chosen, select the more icon and choose “Set as Working Directory”*

# Creation of R script File

---

- From **FILE** Menu
- Or
- From **NEW Icon** of Toolbar

# Writing Script File

- Write R Script on to R file or can Run the Commands directly from the Console.
  
- Save the file to the location set as working directory
  - Or
- Can use **Save Icon** from the Toolbar

# Run the Script file

- Use **RUN** icon from the Toolbar
  - Or
  - **Press Ctrl + Enter**
- **Run can be used to execute selected lines**
  - Source/ Source with echo is for a whole file
- **Advantages – using Run :**
  - troubleshooting/debugging
- **Disadvantages – using Run :**
  - For large section, console will be over populated and messy

# Comments in R

- Add comments –single line
  - For single line comment, insert ‘#’ at the start of the line
- Add comments –Multi line
  - 1) Select multiple lines using cursor, then press  
**“Ctrl + Shift + C”**  
(OR)
  - 2) Select multiple lines using cursor, click on “Code” in menu and select **“Comment/Uncomment lines”**

# Clear the Console

- To Clear the console  
Use “**control +L**”
- Clear the environment `-rm()`
  - Single variable: Enter in console/R script :  
**`rm(variable)`**
  - All variables: Enter in console/R script :  
**`rm(list=ls())`**

# Assignment Operations

- `>` is the prompt sign in R.
  - The assignment operators are the left arrow with dash `<-` and **equal sign** `=`.
- `> x <- 20` assigns the value 20 to x.
- `> x = 20` assigns the value 20 to x.
  - Initially only `<-` was available in R.

`> x = 20` assigns the value 20 to x.

`> y = x * 2` assigns the value  $2 * x$  to y.

`> z = x + y` assigns the value  $x + y$  to z.

# Case Sensitive

- Capital and small letters are different.
- `> X <- 20` and
- `> x <- 20` are different

# Variables & Constants

- **Rules**

- Allowed characters are Alphanumeric, ‘\_’ and ‘.’
- Always start with alphabets
- No special characters like !, @, #, \$, ....

- **Predefined constants**

<b>Constant</b>	<b>Symbol in R</b>
1. <i>Pi</i>	pi
2. <i>letters</i>	a,b,c,.....x,y,z
3. <i>LETTERS</i>	A,B,,.....,X,Y,Z
4. <i>Months in a year</i>	month.name, month.abb

# Arithmetic Operations

>  $2+3$  # **Command**

o/p: [1] 5 # **Output**

>  $2*3$  # **Command**

o/p: [1] 6 # **Output**

>  $2-3$  # **Command**

o/p: [1] -1 # **Output**

>  $3/2$  # **Command**

o/p: [1] 1.5 # **Output**

>  $2*3-4+5/6$  # **Command**

o/p: [1] 2.8333 # **Output**

# Arithmetic Operators

>  $2^3$  # Command

o/p: [1] 8 # Output

>  $2^{**}3$  # Command

o/p: [1] 8 # Output

>  $2^{0.5}$  # Command

o/p: [1] 1.414214 # Output

>  $2^{**}0.5$  # Command

o/p: [1] 1.414214 # Output  $2^{1/2}$

>  $2^{-0.5}$  # Command

o/p: [1] 0.7071068 # Output

# Basic data types

## Basic data types

1. Logical
2. Integer
3. Numeric
4. Complex
5. Character

## Values

TRUE and FALSE

Set of all integers,  $Z$

Set of all real numbers

Set of complex numbers

“a””b””c”,....,”x””y””z””@””#””\$”,  
“””\*” “1””2”... etc..

# Basic objects

## Object

## Values

- |                      |                                       |
|----------------------|---------------------------------------|
| 1. <i>Vector</i>     | Ordered collection of same data types |
| 2. <i>List</i>       | Ordered collection of objects         |
| 3. <i>Data frame</i> | Generic tabular object                |
| 4. Matrices          |                                       |
| 5. Arrays            |                                       |
| 6. Data Frames       |                                       |

# Vectors

- Vector : an ordered collection of basic data types of given length
- All the elements of a vector must be of same data type

Example:

```
X = c(2.3,4.5,6.7,8.9)
```

```
print(X)
```

# Built-in Functions

- **min()** Minimum value
- **max()** Maximum value
- **abs()** Absolute value
- **sqrt()** Square root
- **round(), floor(), ceiling()** Rounding, up and down
- **sum(), prod()** Sum and product
- **log(), log10(), log2()** Logarithms
- **exp()** Exponential function
- **sin(), cos(), tan()** Trigonometric functions

# Math Functions

---

- $\text{abs}(c(-3,-6,-1,9))$
- $\text{max}(c(4.5,6.9,23.4,12.7))$
- $\text{round}(2.8)$

# Types of Operators

---

- Arithmetic Operators
- Relational Operators
- Logical Operators
- Assignment Operators
- Miscellaneous Operators

# Conditional statements

- `if ( condition ) {executed commands if condition is TRUE}`
- `if ( condition ) {executed commands if condition is TRUE}`  
`else { executed commands if condition is FALSE }`
- `ifelse(test, yes, no)`

## Example

```
> X <- 1:10
```

```
> X
```

```
[1] 1 2 3 4 5 6 7 8 9 10
```

```
> ifelse( x<6, x^2, x+1 )
```

```
[1] 1 4 9 16 25 7 8 9 10 11
```

# Loops

1. for loop
2. while loop
3. repeat loop

## Syntax

**for (name in vector) {commands to be executed}**

## Example

- **> for ( i in 1:5 ) { print( i^2 ) }**

o/p: 1 4 9 16 25

- **> for ( i in c(2,4,6,7) ) { print( i^2 ) }**

- 4 16 36 49

# While Loop

**1. while(condition){ commands to be executed as long as condition is TRUE }**

## Example

```
> i <- 1
> while (i<5) {
  print(i^2)
  i <- i+2 }
```

**2. repeat{ commands to be executed }**

```
i <- 1
> repeat{
  print( i^2 )
  i <- i+2
  if ( i > 10 ) break
}
```

# sequence

- A sequence is a set of related numbers, events, movements, or items that follow each other in a particular order.

Syntax

>**seq()**

- **seq(from = 1, to = 1, by = ((to - from)/(length.out - 1)), length.out = NULL, along.with = NULL, ...)**

Example:

- ✓ **seq(from=2, to=4)**
- ✓ **seq(from=-4, to=4)**

# Sequence with constant increment

- Generate a sequence from 10 to 20 with an increment of 2 units
- > `seq(from=10, to=20, by=2)`
- [1] 10 12 14 16 18 20
  
- Generate a sequence from 3 to -2 with a decrement of 0.5 units
- > `seq(from=3, to=-2, by=-0.5)`

- Sequences with a predefined length with default increment +1
- > **seq(to=10, length=10)**
- [1] 1 2 3 4 5 6 7 8 9 10
  
- Sequences with a predefined length with constant fractional increment
- > **seq(from=10, length=10, by=0.1)**

# Lists

- List : a generic object consisting of an ordered collection of objects
- A list could consist of a numeric vector, a logical value, a matrix, a complex vector, a character array, a function, and so on

## Example:

```
ID = c(1,2,3,4)
```

```
std.name =c("Rachana", "Hasini", "Shaila", "Danush")
```

```
num.std = 4
```

```
std.list = list(ID, std.name, num.std)
```

```
print(std.list)
```

# Accessing components (indices)

- To access top level components, use double slicing operator “[[ ]]” and for lower/inner level components use “[ ]” along with “[[ ]]”

## Example:

```
print(std.list[[1]])
```

```
print(std.list[[2]])
```

```
print(std.list[[1]][1])
```

```
print(std.list[[2]][1])
```

**Thanks for your  
attention!**

**Any questions?**
